# Chapter 1

## GALAHAD C package bls

### 1.1 Introduction

#### 1.1.1 Purpose

This package uses a preconditioned, projected-gradient method to solve the **bound-constrained regularized linear least-squares problem**

$$\text{minimize } q(x) = q(x) = \frac{1}{2}\|Ax - b\|_2^2 + \frac{1}{2}\sigma\|x\|^2$$

subject to the simple bound constraints

$$x_j^l \leq x_j \leq x_j^u, \quad j = 1, \dots, n,$$

where the  $m$  by  $n$  real matrix  $A$ , the vectors  $b$ ,  $x^l$ ,  $x^u$  and the non-negative weight  $\sigma$  are given. Any of the constraint bounds  $x_j^l$  and  $x_j^u$  may be infinite. Full advantage is taken of any zero coefficients of the Jacobian matrix  $A$  of the **residuals**  $c(x) = Ax - b$ ; the matrix need not be provided as there are options to obtain matrix-vector products involving  $A$  and its transpose either by reverse communication or from a user-provided subroutine.

#### 1.1.2 Authors

N. I. M. Gould, STFC-Rutherford Appleton Laboratory, England.

C interface, additionally J. Fowkes, STFC-Rutherford Appleton Laboratory.

### 1.1.4 Terminology

The required solution  $x$  necessarily satisfies the primal optimality conditions

$$x^l \leq x \leq x^u,$$

the dual optimality conditions

$$(A^T A + \sigma I)x = A^T b + z$$

where

$$z = z^l + z^u, \quad z^l \geq 0 \quad \text{and} \quad z^u \leq 0,$$

and the complementary slackness conditions

$$(x - x^l)^T z^l = 0 \quad \text{and} \quad (x - x^u)^T z^u = 0,$$

where the vector  $z$  is known as the dual variables for the bounds, respectively, and where the vector inequalities hold component-wise.

### 1.1.5 Method

The method is iterative. Each iteration proceeds in two stages. Firstly, a search direction  $s$  from the current estimate of the solution  $x$  is computed. This may be in a scaled steepest-descent direction, or, if the working set of variables on bounds has not changed dramatically, in a direction that provides an approximate minimizer of the objective over a subspace comprising the currently free-variables. The latter is computed either using an appropriate sparse factorization by the GALAHAD package SBLS, or by the conjugate-gradient least-squares (CGLS) method; it may be necessary to regularize the subproblem very slightly to avoid a ill-posedness. Thereafter, a piecewise linesearch (arc search) is carried out along the arc  $x(\alpha) = P(x + \alpha s)$  for  $\alpha > 0$ , where the projection operator is defined component-wise at any feasible point  $v$  to be

$$P_j(v) = \min(\max(x_j, x_j^l), x_j^u);$$

thus this arc bends the search direction into the feasible region. The arc search is performed either exactly, by passing through a set of increasing breakpoints at which it changes direction, or inexactly, by evaluating a sequence of different  $\alpha$  on the arc. All computation is designed to exploit sparsity in  $A$ .

### 1.1.6 Reference

Full details are provided in

N. I. M. Gould (2022). Numerical methods for solving bound-constrained linear least squares problems. In preparation.

### 1.1.7 Call order

To solve a given problem, functions from the blls package must be called in the following order:

- [blls\\_initialize](#) - provide default control parameters and set up initial data structures
- [blls\\_read\\_specfile](#) (optional) - override control values by reading replacement values from a file
- set up problem data structures and fixed values by calling one of
  - [blls\\_import](#) - in the case that  $A$  is explicitly available

- `blls_import_without_a` - in the case that only the effect of applying  $A$  and its transpose to a vector is possible
- `blls_reset_control` (optional) - possibly change control parameters if a sequence of problems are being solved
- solve the problem by calling one of
  - `blls_solve_given_a` - solve the problem using values of  $A$
  - `blls_solve_reverse_a_prod` - solve the problem by returning to the caller for products of  $A$  and its transpose with specified vectors
- `blls_information` (optional) - recover information about the solution and solution process
- `blls_terminate` - deallocate data structures

See Section 4.1 for examples of use.

### 1.1.8 Unsymmetric matrix storage formats

The unsymmetric  $m$  by  $n$  matrix  $A$  may be presented and stored in a variety of convenient input formats.

Both C-style (0 based) and fortran-style (1-based) indexing is allowed. Choose `control.f_indexing` as `false` for C style and `true` for fortran style; the discussion below presumes C style, but add 1 to indices for the corresponding fortran version.

Wrappers will automatically convert between 0-based (C) and 1-based (fortran) array indexing, so may be used transparently from C. This conversion involves both time and memory overheads that may be avoided by supplying data that is already stored using 1-based indexing.

#### 1.1.8.1 Dense row storage format

The matrix  $A$  is stored as a compact dense matrix by rows, that is, the values of the entries of each row in turn are stored in order within an appropriate real one-dimensional array. In this case, component  $n * i + j$  of the storage array `A_val` will hold the value  $A_{ij}$  for  $0 \leq i \leq m - 1$ ,  $0 \leq j \leq n - 1$ .

#### 1.1.8.2 Dense column storage format

The matrix  $A$  is stored as a compact dense matrix by columns, that is, the values of the entries of each column in turn are stored in order within an appropriate real one-dimensional array. In this case, component  $m * j + i$  of the storage array `A_val` will hold the value  $A_{ij}$  for  $0 \leq i \leq m - 1$ ,  $0 \leq j \leq n - 1$ .

#### 1.1.8.3 Sparse co-ordinate storage format

Only the nonzero entries of the matrices are stored. For the  $l$ -th entry,  $0 \leq l \leq ne - 1$ , of  $A$ , its row index  $i$ , column index  $j$  and value  $A_{ij}$ ,  $0 \leq i \leq m - 1$ ,  $0 \leq j \leq n - 1$ , are stored as the  $l$ -th components of the integer arrays `A_row` and `A_col` and real array `A_val`, respectively, while the number of nonzeros is recorded as `A_ne = ne`.

#### 1.1.8.4 Sparse row-wise storage format

Again only the nonzero entries are stored, but this time they are ordered so that those in row  $i$  appear directly before those in row  $i+1$ . For the  $i$ -th row of  $A$  the  $i$ -th component of the integer array  $A\_ptr$  holds the position of the first entry in this row, while  $A\_ptr(m)$  holds the total number of entries plus one. The column indices  $j$ ,  $0 \leq j \leq n-1$ , and values  $A_{ij}$  of the nonzero entries in the  $i$ -th row are stored in components  $l = A\_ptr(i), \dots, A\_ptr(i+1)-1$ ,  $0 \leq i \leq m-1$ , of the integer array  $A\_col$ , and real array  $A\_val$ , respectively. For sparse matrices, this scheme almost always requires less storage than its predecessors.

#### 1.1.8.5 Sparse column-wise storage format

Again only the nonzero entries are stored, but this time they are ordered so that those in column  $j$  appear directly before those in column  $j+1$ . For the  $j$ -th column of  $A$  the  $j$ -th component of the integer array  $A\_ptr$  holds the position of the first entry in this column, while  $A\_ptr(n)$  holds the total number of entries plus one. The row indices  $i$ ,  $0 \leq i \leq m-1$ , and values  $A_{ij}$  of the nonzero entries in the  $j$ -th column are stored in components  $l = A\_ptr(j), \dots, A\_ptr(j+1)-1$ ,  $0 \leq j \leq n-1$ , of the integer array  $A\_row$ , and real array  $A\_val$ , respectively. Once again, for sparse matrices, this scheme almost always requires less storage than the dense of coordinate formats.

| int      | start_print              | on which iteration to start printing                                                                                                                                                                                                                                                   |
| int      | stop_print               | on which iteration to stop printing                                                                                                                                                                                                                                                    |
| int      | print_gap                | how many iterations between printing                                                                                                                                                                                                                                                   |
| int      | maxit                    | how many iterations to perform (-ve reverts to HUGE(1)-1)                                                                                                                                                                                                                              |
| int      | cold_start               | cold_start should be set to 0 if a warm start is required (with variable assigned according to X_stat, see below), and to any other value if the values given in prob.X suffice                                                                                                        |
| int      | preconditioner           | the preconditioner (scaling) used. Possible values are: /li 0. no preconditioner. /li 1. a diagonal preconditioner that normalizes the rows of $A$ . /li anything else. a preconditioner supplied by the user either via a subroutine call of eval_prec) or via reverse communication. |
| int      | ratio_cg_vs_sd           | the ratio of how many iterations use CGLS rather than steepest descent                                                                                                                                                                                                                 |
| int      | change_max               | the maximum number of per-iteration changes in the working set permitted when allowing CGLS rather than steepest descent                                                                                                                                                               |
| int      | cg_maxit                 | how many CG iterations to perform per BLLS iteration (-ve reverts to n+1)                                                                                                                                                                                                              |
| int      | arcsearch_max_steps      | the maximum number of steps allowed in a piecewise arcsearch (-ve=infini                                                                                                                                                                                                               |
| int      | sif_file_device          | the unit number to write generated SIF file describing the current probl                                                                                                                                                                                                               |
| real_wp_ | weight                   | the objective function will be regularized by adding $1/2 \text{ weight }   x  ^2$                                                                                                                                                                                                     |
| real_wp_ | infinity                 | any bound larger than infinity in modulus will be regarded as infinite                                                                                                                                                                                                                 |
| real_wp_ | stop_d                   | the required accuracy for the dual infeasibility                                                                                                                                                                                                                                       |
| real_wp_ | identical_bounds_tol     | any pair of constraint bounds ( $x_l, x_u$ ) that are closer than identical_bounds_tol will be reset to the average of their values                                                                                                                                                    |
| real_wp_ | stop_cg_relative         | the CG iteration will be stopped as soon as the current norm of the preconditioned gradient is smaller than $\max(\text{stop\_cg\_relative} * \text{initial preconditioned gradient}, \text{stop\_cg\_absolute})$                                                                      |
| real_wp_ | stop_cg_absolute         |                                                                                                                                                                                                                                                                                        |
| real_wp_ | alpha_max                | the largest permitted arc length during the piecewise line search                                                                                                                                                                                                                      |
| real_wp_ | alpha_initial            | the initial arc length during the inexact piecewise line search                                                                                                                                                                                                                        |
| real_wp_ | alpha_reduction          | the arc length reduction factor for the inexact piecewise line search                                                                                                                                                                                                                  |
| real_wp_ | arcsearch_acceptance_tol | the required relative reduction during the inexact piecewise line search                                                                                                                                                                                                               |

## Data Fields

|                             |                         |                                                                                                                                                                                          |
|-----------------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| real_wp_                    | stabilisation_weight    | the stabilisation weight added to the search-direction subproblem                                                                                                                        |
| real_wp_                    | cpu_time_limit          | the maximum CPU time allowed (-ve = no limit)                                                                                                                                            |
| bool                        | direct_subproblem_solve | direct_subproblem_solve is true if the least-squares subproblem is to be solved using a matrix factorization, and false if conjugate gradients are to be preferred                       |
| bool                        | exact_arc_search        | exact_arc_search is true if an exact arc_search is required, and false if an approximation suffices                                                                                      |
| bool                        | advance                 | advance is true if an inexact exact arc_search can increase steps as well as decrease them                                                                                               |
| bool                        | space_critical          | if space_critical is true, every effort will be made to use as little space as possible. This may result in longer computation times                                                     |
| bool                        | deallocate_error_fatal  | if deallocate_error_fatal is true, any array/pointer deallocation error will terminate execution. Otherwise, computation will continue                                                   |
| bool                        | generate_sif_file       | if generate_sif_file is true, a SIF file describing the current problem will be generated                                                                                                |
| char                        | sif_file_name[31]       | name (max 30 characters) of generated SIF file containing input problem                                                                                                                  |
| char                        | prefix[31]              | all output lines will be prefixed by a string (max 30 characters) prefix(2:LEN(TRIM(.prefix))-1) where prefix contains the required string enclosed in quotes, e.g. "string" or 'string' |
| struct sbbs_control_type    | sbbs_control            | control parameters for SBLS                                                                                                                                                              |
| struct convert_control_type | convert_control         | control parameters for CONVERT                                                                                                                                                           |

## 3.1.1.2 struct blls\_time\_type

time derived type as a C struct

## Data Fields

|          |           |                                    |
|----------|-----------|------------------------------------|
| real_sp_ | total     | total time                         |
| real_sp_ | analyse   | time for the analysis phase        |
| real_sp_ | factorize | time for the factorization phase   |
| real_sp_ | solve     | time for the linear solution phase |

## 3.1.1.3 struct blls\_inform\_type

inform derived type as a C struct

## Examples

[bllst.c](#), and [bllstf.c](#).

## Data Fields

|                                            |                      |                                                  |
|--------------------------------------------|----------------------|--------------------------------------------------|
| int                                        | status               | reported return status.                          |
| int                                        | alloc_status         | Fortran STAT value after allocate failure.       |
| int                                        | factorization_status | status return from factorization                 |
| int                                        | iter                 | number of iterations required                    |
| int                                        | cg_iter              | number of CG iterations required                 |
| real_wp_                                   | obj                  | current value of the objective function          |
| real_wp_                                   | norm_pg              | current value of the projected gradient          |
| char                                       | bad_alloc[81]        | name of array which provoked an allocate failure |
| struct <a href="#">blls_time_type</a>      | time                 | times for various stages                         |
| struct <a href="#">sbls_inform_type</a>    | sbls_inform          | inform values from SBLS                          |
| struct <a href="#">convert_inform_type</a> | convert_inform       | inform values for CONVERT                        |

### 3.1.2 Function Documentation

#### 3.1.2.1 [blls\\_initialize\(\)](#)

```
void blls_initialize (
    void ** data,
    struct blls\_control\_type * control,
    int * status )
```

Set default control values and initialize private data

## Parameters

|         |                |                                                                                                                                                                                                  |
|---------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in, out | <i>data</i>    | holds private internal data                                                                                                                                                                      |
| out     | <i>control</i> | is a struct containing control information (see <a href="#">blls_control_type</a> )                                                                                                              |
| out     | <i>status</i>  | is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> <li>• 0. The import was succesful.</li> </ul> |

## Examples

[bllst.c](#), and [bllstf.c](#).

#### 3.1.2.2 [blls\\_read\\_specfile\(\)](#)

```
void blls_read_specfile (
    struct blls\_control\_type * control,
    const char specfile[] )
```

Read the content of a specification file, and assign values associated with given keywords to the corresponding control parameters

#### Parameters

|         |                 |                                                                                     |
|---------|-----------------|-------------------------------------------------------------------------------------|
| in, out | <i>control</i>  | is a struct containing control information (see <a href="#">blls_control_type</a> ) |
| in      | <i>specfile</i> | is a character string containing the name of the specification file                 |

### 3.1.2.3 blls\_import()

```
void blls_import (
    struct blls\_control\_type * control,
    void ** data,
    int * status,
    int n,
    int m,
    const char A_type[],
    int A_ne,
    const int A_row[],
    const int A_col[],
    const int A_ptr[] )
```

Import problem data into internal storage prior to solution.

#### Parameters

|         |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in      | <i>control</i> | is a struct whose members provide control paramters for the remaining prcedures (see <a href="#">blls_control_type</a> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| in, out | <i>data</i>    | holds private internal data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| in, out | <i>status</i>  | is a scalar variable of type int, that gives the exit status from the package. Possible values are: <ul style="list-style-type: none"> <li>• 1. The import was succesful, and the package is ready for the solve phase</li> <li>• -1. An allocation error occurred. A message indicating the offending array is written on unit control.error, and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -2. A deallocation error occurred. A message indicating the offending array is written on unit control.error and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -3. The restrictions <math>n &gt; 0</math>, <math>m &gt; 0</math> or requirement that type contains its relevant string 'coordinate', 'sparse_by_rows', 'sparse_by_columns', 'dense_by_rows', or 'dense_by_columns'; has been violated.</li> </ul> |
| in      | <i>n</i>       | is a scalar variable of type int, that holds the number of variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| in      | <i>m</i>       | is a scalar variable of type int, that holds the number of residuals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| in      | <i>A_type</i>  | is a one-dimensional array of type char that specifies the <a href="#">symmetric storage scheme</a> used for the Jacobian $A$ . It should be one of 'coordinate', 'sparse_by_rows', 'sparse_by_columns', 'dense_by_rows', or 'dense_by_columns'; lower or upper case variants are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Parameters

|    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in | <i>A_ne</i>  | is a scalar variable of type int, that holds the number of entries in <i>A</i> in the sparse co-ordinate storage scheme. It need not be set for any of the other schemes.                                                                                                                                                                                                                                                                                         |
| in | <i>A_row</i> | is a one-dimensional array of size <i>A_ne</i> and type int, that holds the row indices of <i>A</i> in the sparse co-ordinate or sparse column-wise storage scheme. It need not be set for any of the other schemes, and in this case can be NULL.                                                                                                                                                                                                                |
| in | <i>A_col</i> | is a one-dimensional array of size <i>A_ne</i> and type int, that holds the column indices of <i>A</i> in either the sparse co-ordinate, or the sparse row-wise storage scheme. It need not be set for any of the other schemes, and in this case can be NULL.                                                                                                                                                                                                    |
| in | <i>A_ptr</i> | is a one-dimensional array of size <i>n</i> +1 or <i>m</i> +1 and type int, that holds the starting position of each row of <i>A</i> , as well as the total number of entries plus one, in the sparse row-wise storage scheme, or the starting position of each column of <i>A</i> , as well as the total number of entries plus one, in the sparse column-wise storage scheme. It need not be set when the other schemes are used, and in this case can be NULL. |

## Examples

[bllst.c](#), and [bllstf.c](#).

## 3.1.2.4 blls\_import\_without\_a()

```
void blls_import_without_a (
    struct blls_control_type * control,
    void ** data,
    int * status,
    int n,
    int m )
```

Import problem data into internal storage prior to solution.

## Parameters

|                    |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in                 | <i>control</i> | is a struct whose members provide control paramters for the remaining pcedures (see <a href="#">blls_control_type</a> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| in, out            | <i>data</i>    | holds private internal data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| in, out            | <i>status</i>  | is a scalar variable of type int, that gives the exit status from the package. Possible values are: <ul style="list-style-type: none"> <li>• 1. The import was succesful, and the package is ready for the solve phase</li> <li>• -1. An allocation error occurred. A message indicating the offending array is written on unit control.error, and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -2. A deallocation error occurred. A message indicating the offending array is written on unit control.error and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -3. The restriction <math>n &gt; 0</math> or <math>m &gt; 0</math> has been violated.</li> </ul> |
| in                 | <i>n</i>       | is a scalar variable of type int, that holds the number of variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>GALAHAD 4.0</b> | <i>m</i>       | is a scalar variable of type int, that holds the number of residuals.c interfaces to GALAHAD BLLS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Examples

[bllst.c](#), and [bllstf.c](#).

## 3.1.2.5 blls\_reset\_control()

```
void blls_reset_control (
    struct blls_control_type * control,
    void ** data,
    int * status )
```

Reset control parameters after import if required.

## Parameters

|         |                |                                                                                                                                                                                                                                  |
|---------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in      | <i>control</i> | is a struct whose members provide control parameters for the remaining procedures (see <a href="#">blls_control_type</a> )                                                                                                       |
| in, out | <i>data</i>    | holds private internal data                                                                                                                                                                                                      |
| in, out | <i>status</i>  | is a scalar variable of type int, that gives the exit status from the package. Possible values are: <ul style="list-style-type: none"> <li>1. The import was successful, and the package is ready for the solve phase</li> </ul> |

## 3.1.2.6 blls\_solve\_given\_a()

```
void blls_solve_given_a (
    void ** data,
    void * userdata,
    int * status,
    int n,
    int m,
    int A_ne,
    const real_wp_ A_val[],
    const real_wp_ b[],
    const real_wp_ x_l[],
    const real_wp_ x_u[],
    real_wp_ y[],
    real_wp_ z[],
    real_wp_ c[],
    real_wp_ g[],
    int x_stat[],
    int (*)(int, const real_wp_[], real_wp_[], const void *) eval_prec )
```

Solve the bound-constrained linear least-squares problem when the Jacobian  $A$  is available.

## Parameters

|         |             |                             |
|---------|-------------|-----------------------------|
| in, out | <i>data</i> | holds private internal data |
|---------|-------------|-----------------------------|

## Parameters

|         |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| in      | <i>userdata</i> | is a structure that allows data to be passed into the function and derivative evaluation programs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| in, out | <i>status</i>   | <p>is a scalar variable of type int, that gives the entry and exit status from the package. On initial entry, status must be set to 1.<br/>Possible exit are:</p> <ul style="list-style-type: none"> <li>• 0. The run was succesful.</li> <li>• -1. An allocation error occurred. A message indicating the offending array is written on unit control.error, and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -2. A deallocation error occurred. A message indicating the offending array is written on unit control.error and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively.</li> <li>• -3. The restrictions <math>n &gt; 0</math>, <math>m &gt; 0</math> or requirement that a type contains its relevant string 'coordinate', 'sparse_by_rows', 'sparse_by_columns', 'dense_by_rows' or 'dense_by_columns' has been violated.</li> <li>• -4. The simple-bound constraints are inconsistent.</li> <li>• -9. The analysis phase of the factorization failed; the return status from the factorization package is given in the component inform.factor_status</li> <li>• -10. The factorization failed; the return status from the factorization package is given in the component inform.factor_status.</li> <li>• -18. Too many iterations have been performed. This may happen if control.maxit is too small, but may also be symptomatic of a badly scaled problem.</li> <li>• -19. The CPU time limit has been reached. This may happen if control.cpu_time_limit is too small, but may also be symptomatic of a badly scaled problem.</li> </ul> |
| in      | <i>n</i>        | is a scalar variable of type int, that holds the number of variables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| in      | <i>m</i>        | is a scalar variable of type int, that holds the number of residuals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| in      | <i>A_ne</i>     | is a scalar variable of type int, that holds the number of entries in the lower triangular part of the Hessian matrix $H$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| in      | <i>A_val</i>    | is a one-dimensional array of size <i>A_ne</i> and type double, that holds the values of the entries of the lower triangular part of the Hessian matrix $H$ in any of the available storage schemes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| in      | <i>b</i>        | is a one-dimensional array of size <i>m</i> and type double, that holds the constant term $b$ in the residuals. The <i>i</i> -th component of <i>b</i> , $i = 0, \dots, m-1$ , contains $b_i$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|---------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| out     | <i>c</i>         | is a one-dimensional array of size m and type double, that holds the values of the residuals $c = Ax - b$ . The i-th component of c, $i = 0, \dots, m-1$ , contains $c_i$ .                                                                                                                                                                                                                                                                                                                                                          |
| out     | <i>g</i>         | is a one-dimensional array of size n and type double, that holds the values of the gradient $g = A^T c$ . The j-th component of g, $j = 0, \dots, n-1$ , contains $g_j$ .                                                                                                                                                                                                                                                                                                                                                            |
| in, out | <i>x_stat</i>    | is a one-dimensional array of size n and type int, that gives the optimal status of the problem variables. If $x\_stat(j)$ is negative, the variable $x_j$ most likely lies on its lower bound, if it is positive, it lies on its upper bound, and if it is zero, it lies between its bounds.                                                                                                                                                                                                                                        |
|         | <i>eval_prec</i> | is an optional user-supplied function that may be NULL. If non-NULL, it must have the following signature:<br><pre>int eval_prec( int n, const double v[], double p[], const void *userdata )</pre> The product $p = P^{-1}v$ involving the user's preconditioner $P$ with the vector $v = v$ , the result $p$ must be returned in p, and the function return value set to 0. If the evaluation is impossible, return should be set to a nonzero value. Data may be passed into <i>eval_prec</i> via the structure <i>userdata</i> . |

## Examples

[bllst.c](#), and [bllstf.c](#).

## 3.1.2.7 blls\_solve\_reverse\_a\_prod()

```
void blls_solve_reverse_a_prod (
    void ** data,
    int * status,
    int * eval_status,
    int n,
    int m,
    const real_wp_ b[],
    const real_wp_ x_l[],
    const real_wp_ x_u[],
    real_wp_ y[],
    real_wp_ z[],
    real_wp_ c[],
    real_wp_ g[],
    int x_stat[],
    real_wp_ v[],
    const real_wp_ p[],
    int nz_v[],
    int * nz_v_start,
    int * nz_v_end,
    const int nz_p[],
    int nz_p_end )
```

Solve the bound-constrained linear least-squares problem when the products of the Jacobian  $A$  and its transpose with specified vectors may be computed by the calling program.

|  |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <i>status</i> | <p>(continued)</p> <ul style="list-style-type: none"> <li>• 2. The product <math>Av</math> of the residual Jacobian <math>A</math> with a given output vector <math>v</math> is required from the user. The vector <math>v</math> will be stored in <math>v</math> and the product <math>Av</math> must be returned in <math>p</math>, <code>status_eval</code> should be set to 0, and <code>blls_solve_reverse_a_prod</code> re-entered with all other arguments unchanged. If the product cannot be formed, <math>v</math> need not be set, but <code>blls_solve_reverse_a_prod</code> should be re-entered with <code>eval_status</code> set to a nonzero value.</li> <li>• 3. The product <math>A^T v</math> of the transpose of the residual Jacobian <math>A</math> with a given output vector <math>v</math> is required from the user. The vector <math>v</math> will be stored in <math>v</math> and the product <math>A^T v</math> must be returned in <math>p</math>, <code>status_eval</code> should be set to 0, and <code>blls_solve_reverse_a_prod</code> re-entered with all other arguments unchanged. If the product cannot be formed, <math>v</math> need not be set, but <code>blls_solve_reverse_a_prod</code> should be re-entered with <code>eval_status</code> set to a nonzero value.</li> <li>• 4. The product <math>Av</math> of the residual Jacobian <math>A</math> with a given sparse output vector <math>v</math> is required from the user. The nonzero components of the vector <math>v</math> will be stored as entries <code>nz_in[nz_in_start-1:nz_in_end-1]</code> of <math>v</math> and the product <math>Av</math> must be returned in <math>p</math>, <code>status_eval</code> should be set to 0, and <code>blls_solve_reverse_a_prod</code> re-entered with all other arguments unchanged; The remaining components of <math>v</math> should be ignored. If the product cannot be formed, <math>v</math> need not be set, but <code>blls_solve_reverse_a_prod</code> should be re-entered with <code>eval_status</code> set to a nonzero value.</li> <li>• 5. The nonzero components of the product <math>Av</math> of the residual Jacobian <math>A</math> with a given sparse output vector <math>v</math> is required from the user. The nonzero components of the vector <math>v</math> will be stored as entries <code>nz_in[nz_in_start-1:nz_in_end-1]</code> of <math>v</math>; the remaining components of <math>v</math> should be ignored. The resulting <b>nonzeros</b> in the product <math>Av</math> must be placed in their appropriate components of <math>p</math>, while a list of indices of the nonzeros placed in <code>nz_out[0 : nz_out_end-1]</code> and the number of nonzeros recorded in <code>nz_out_end</code>. Additionally, <code>status_eval</code> should be set to 0, and <code>blls_solve_reverse_a_prod</code> re-entered with all other arguments unchanged. If the product cannot be formed, <math>v</math>, <code>nz_out_end</code> and <code>nz_out</code> need not be set, but <code>blls_solve_reverse_a_prod</code> should be re-entered with <code>eval_status</code> set to a nonzero value.</li> <li>• 6. A subset of the product <math>A^T v</math> of the transpose of the residual Jacobian <math>A</math> with a given output vector <math>v</math> is required from the user. The vector <math>v</math> will be stored in <math>v</math> and components <code>nz_in[nz_in_start-1:nz_in_end-1]</code> of the product <math>A^T v</math> must be returned in the relevant components of <math>p</math> (the remaining components should not be set), <code>status_eval</code> should be set to 0, and <code>blls_solve_reverse_a_prod</code> re-entered with all other arguments unchanged. If the product cannot be formed, <math>v</math> need not be set, but <code>blls_solve_reverse_a_prod</code> should be re-entered with <code>eval_status</code> set to a nonzero value.</li> <li>• 7. The product <math>P^{-1}v</math> of the inverse of the preconditioner <math>P</math> with a given output vector <math>v</math> is required from the user. The vector <math>v</math> will be stored in <math>v</math> and the product <math>P^{-1}v</math> must be returned in <math>p</math>, <code>status_eval</code> should be set to 0, and <code>blls_solve_reverse_a_prod</code> re-entered with all other arguments unchanged. If the product cannot be formed, <math>v</math> need not be set, but <code>blls_solve_reverse_a_prod</code> should be re-entered with <code>eval_status</code> set to a nonzero value. This value of status can only occur if the user has set <code>control.preconditioner = 2</code>.</li> </ul> |

## 3.1.2.8 blls\_information()

```
void blls_information (
    void ** data,
    struct blls_inform_type * inform,
    int * status )
```

Provides output information

## Parameters

|         |               |                                                                                                                                                                                                             |
|---------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| in, out | <i>data</i>   | holds private internal data                                                                                                                                                                                 |
| out     | <i>inform</i> | is a struct containing output information (see <a href="#">blls_inform_type</a> )                                                                                                                           |
| out     | <i>status</i> | is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> <li>• 0. The values were recorded succesfully</li> </ul> |

## Examples

[bllst.c](#), and [bllstf.c](#).

## 3.1.2.9 blls\_terminate()

```
void blls_terminate (
    void ** data,
    struct blls_control_type * control,
    struct blls_inform_type * inform )
```

Deallocate all internal private storage

## Parameters

|         |                |                                                                                     |
|---------|----------------|-------------------------------------------------------------------------------------|
| in, out | <i>data</i>    | holds private internal data                                                         |
| out     | <i>control</i> | is a struct containing control information (see <a href="#">blls_control_type</a> ) |
| out     | <i>inform</i>  | is a struct containing output information (see <a href="#">blls_inform_type</a> )   |

## Examples

[bllst.c](#), and [bllstf.c](#).

## Chapter 4

# Example Documentation

### 4.1 bllst.c

This is an example of how to use the package to solve a bound-constrained linear least-squares problem. A variety of supported Jacobian storage formats are shown. An example of preconditioning, in this case with the identity matrix which actually achieves nothing, is also illustrated.

Notice that C-style indexing is used, and that this is flagged by setting `control.f_indexing` to false.

```
/* bllst.c */
/* Full test for the BLLS C interface using C sparse matrix indexing */
#include <stdio.h>
#include <math.h>
#include <string.h>
#include "blls.h"
// define max
#define max(a,b) \
({ \
    __typeof__ (a) _a = (a); \
    __typeof__ (b) _b = (b); \
    _a > _b ? _a : _b; \
})
// Custom userdata struct
struct userdata_type {
    double scale;
};
// Function prototypes
int prec( int n, const double v[], double p[], const void * );
int main(void) {
    // Derived types
    void *data;
    struct blls_control_type control;
    struct blls_inform_type inform;
    // Set user data
    struct userdata_type userdata;
    userdata.scale = 1.0;
    // Set problem data
    int n = 10; // dimension
    int m = n + 1; // number of residuals
    int A_ne = 2 * n; // sparse Jacobian elements
    int A_dense_ne = m * n; // dense Jacobian elements
    // row-wise storage
    int A_row[A_ne]; // row indices,
    int A_col[A_ne]; // column indices
    int A_ptr[m+1]; // row pointers
    double A_val[A_ne]; // values
    double A_dense[A_dense_ne]; // dense values
    // column-wise storage
    int A_by_col_row[A_ne]; // row indices,
    int A_by_col_ptr[n+1]; // column pointers
