# Chapter 1

## GALAHAD C package sha

### 1.1 Introduction

#### 1.1.1 Purpose

Find an approximation to a sparse Hessian using componentwise secant approximation.

Currently, only the control and inform parameters are exposed; these are provided and used by other GALAHAD packages with C interfaces.

#### 1.1.2 Authors

N. I. M. Gould, STFC-Rutherford Appleton Laboratory, England.

C interface, additionally J. Fowkes, STFC-Rutherford Appleton Laboratory.

Julia interface, additionally A. Montoison and D. Orban, Polytechnique Montréal.

#### 1.1.3 Originally released

April 2013, C interface January 2022.

## Chapter 2

# File Index

### 2.1 File List

Here is a list of all files with brief descriptions:

|   |   |
|---|---|
| <a href="#">galahad_sha.h</a> . . . . . | 5 |
|---|---|

## Chapter 3

# File Documentation

### 3.1 galahad\_sha.h File Reference

```
#include <stdbool.h>
#include <stdint.h>
#include "galahad_precision.h"
#include "galahad_cfunctions.h"
```

#### Data Structures

- struct [sha\\_control\\_type](#)
- struct [sha\\_inform\\_type](#)

#### Functions

- void [sha\\_initialize](#) (void \*\*data, struct [sha\\_control\\_type](#) \*control, int \*status)
- void [sha\\_information](#) (void \*\*data, struct [sha\\_inform\\_type](#) \*inform, int \*status)
- void [sha\\_terminate](#) (void \*\*data, struct [sha\\_control\\_type](#) \*control, struct [sha\\_inform\\_type](#) \*inform)

#### 3.1.1 Data Structure Documentation

##### 3.1.1.1 struct sha\_control\_type

control derived type as a C struct

##### Data Fields

|      |             |   |
|------|-------------|---|
| bool | f_indexing  | use C or Fortran sparse matrix indexing   |
| int  | error       | error and warning diagnostics occur on stream error   |
| int  | out         | general output occurs on stream out   |
| int  | print_level | the level of output required. $\leq 0$ gives no output, $= 1$ gives a one-line summary for every iteration, $= 2$ gives a summary of the inner iteration for each iteration, $\geq 3$ gives increasingly verbose (debugging) output |

## Data Fields

|      |                         |  |
|------|-------------------------|--|
| int  | approximation_algorithm | which approximation algorithm should be used?<br><br><ul style="list-style-type: none"> <li>• 0 : unsymmetric (alg 2.1 in paper)</li> <li>• 1 : symmetric (alg 2.2 in paper)</li> <li>• 2 : composite (alg 2.3 in paper)</li> <li>• 3 : composite 2 (alg 2.2/3 in paper)</li> </ul>    |
| int  | dense_linear_solver     | which dense linear equation solver should be used?<br><br><ul style="list-style-type: none"> <li>• 1 : Gaussian elimination</li> <li>• 2 : QR factorization</li> <li>• 3 : singular-value decomposition</li> <li>• 4 : singular-value decomposition with divide-and-conquer</li> </ul> |
| int  | max_sparse_degree       | the maximum sparse degree if the combined version is used  |
| int  | extra_differences       | if available use an addition extra_differences differences   |
| bool | space_critical          | if space is critical, ensure allocated arrays are no bigger than needed  |
| bool | deallocate_error_fatal  | exit if any deallocation fails   |
| char | prefix[31]              | all output lines will be prefixed by .prefix(2:LEN(TRIM(.prefix))-1) where .prefix contains the required string enclosed in quotes, e.g. "string" or 'string'  |

## 3.1.1.2 struct sha\_inform\_type

inform derived type as a C struct

## Data Fields

|      |                    |  |
|------|--------------------|--|
| int  | status             | return status. See SHA_solve for details                                   |
| int  | alloc_status       | the status of the last attempted allocation/deallocation.                  |
| int  | max_degree         | the maximum degree in the adgacency graph.                                 |
| int  | differences_needed | the number of differences that will be needed.                             |
| int  | max_reduced_degree | the maximum reduced degree in the adgacency graph.                         |
| int  | bad_row            | a failure occured when forming the bad_row-th row (0 = no failure).        |
| char | bad_alloc[81]      | the name of the array for which an allocation/deallocation error occurred. |

## 3.1.2 Function Documentation

## 3.1.2.1 sha\_initialize()

```
void sha_initialize (
    void ** data,
```

```

    struct sha_control_type * control,
    int * status )

```

Set default control values and initialize private data

#### Parameters

|         |                |  |
|---------|----------------|--|
| in, out | <i>data</i>    | holds private internal data  |
| out     | <i>control</i> | is a struct containing control information (see <a href="#">sha_control_type</a> )   |
| out     | <i>status</i>  | is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> <li>• 0. The initialization was succesful.</li> </ul> |

### 3.1.2.2 sha\_information()

```

void sha_information (
    void ** data,
    struct sha_inform_type * inform,
    int * status )

```

Provides output information

#### Parameters

|         |               |   |
|---------|---------------|---|
| in, out | <i>data</i>   | holds private internal data   |
| out     | <i>inform</i> | is a struct containing output information (see <a href="#">sha_inform_type</a> )  |
| out     | <i>status</i> | is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> <li>• 0. The values were recorded succesfully</li> </ul> |

### 3.1.2.3 sha\_terminate()

```

void sha_terminate (
    void ** data,
    struct sha_control_type * control,
    struct sha_inform_type * inform )

```

Deallocate all internal private storage

#### Parameters

|         |                |  |
|---------|----------------|--|
| in, out | <i>data</i>    | holds private internal data  |
| out     | <i>control</i> | is a struct containing control information (see <a href="#">sha_control_type</a> ) |
| out     | <i>inform</i>  | is a struct containing output information (see <a href="#">sha_inform_type</a> )   |
