Chapter 1

GALAHAD C package arc

1.1 Introduction

1.1.1 Purpose

The arc package uses a **regularization method to find a (local) unconstrained minimizer of a differentiable objective function $f(\mathbf{x})$ of many variables \mathbf{x}** . The method offers the choice of direct and iterative solution of the key regularization subproblems, and is most suitable for large problems. First derivatives are required, and if second derivatives can be calculated, they will be exploited—if the product of second derivatives with a vector may be found, but not the derivatives themselves, that may also be exploited.

1.1.2 Authors

N. I. M. Gould, STFC-Rutherford Appleton Laboratory, England, and M. Porcelli, University of Bologna, Italy.

C interface, additionally J. Fowkes, STFC-Rutherford Appleton Laboratory.

1.1.3 Originally released

May 2011, C interface August 2021.

1.1.4 Terminology

The *gradient* $\nabla_x f(x)$ of $f(x)$ is the vector whose i -th component is $\partial f(x)/\partial x_i$. The *Hessian* $\nabla_{xx} f(x)$ of $f(x)$ is the symmetric matrix whose i, j -th entry is $\partial^2 f(x)/\partial x_i \partial x_j$. The Hessian is *sparse* if a significant and useful proportion of the entries are universally zero.

1.1.5 Method

An adaptive cubic regularization method is used. In this, an improvement to a current estimate of the required minimizer, x_k is sought by computing a step s_k . The step is chosen to approximately minimize a model $m_k(s)$ of $f(x_k + s)$ that includes a weighted term $\sigma_k \|s_k\|^3$ for some specified positive weight σ_k . The quality of the resulting step s_k is assessed by computing the "ratio" $(f(x_k) - f(x_k + s_k))/(m_k(0) - m_k(s_k))$. The step is deemed to have succeeded if the ratio exceeds a given $\eta_s > 0$, and in this case $x_{k+1} = x_k + s_k$. Otherwise $x_{k+1} = x_k$, and the weight is increased by powers of a given increase factor up to a given limit. If the ratio is larger than $\eta_v \geq \eta_d$, the weight will be decreased by powers of a given decrease factor again up to a given limit. The method will terminate as soon as $\|\nabla_x f(x_k)\|$ is smaller than a specified value.

Either linear or quadratic models $m_k(s)$ may be used. The former will be taken as the first two terms $f(x_k) + s^T \nabla_x f(x_k)$ of a Taylor series about x_k , while the latter uses an approximation to the first three terms $f(x_k) + s^T \nabla_x f(x_k) + \frac{1}{2} s^T B_k s$, for which B_k is a symmetric approximation to the Hessian $\nabla_{xx} f(x_k)$; possible approximations include the true Hessian, limited-memory secant and sparsity approximations and a scaled identity matrix. Normally a two-norm regularization will be used, but this may change if preconditioning is employed.

An approximate minimizer of the cubic model is found using either a direct approach involving factorization or an iterative (conjugate-gradient/Lanczos) approach based on approximations to the required solution from a so-called Krylov subspace. The direct approach is based on the knowledge that the required solution satisfies the linear system of equations $(B_k + \lambda_k I)s_k = -\nabla_x f(x_k)$ involving a scalar Lagrange multiplier λ_k . This multiplier is found by uni-variate root finding, using a safeguarded Newton-like process, by the GALAHAD packages RQS or DPS (depending on the norm chosen). The iterative approach uses the GALAHAD package GLRT, and is best accelerated by preconditioning with good approximations to B_k using GALAHAD's PSLS. The iterative approach has the advantage that only matrix-vector products $B_k v$ are required, and thus B_k is not required explicitly. However when factorizations of B_k are possible, the direct approach is often more efficient.

1.1.6 References

The generic adaptive cubic regularization method is described in detail in

C. Cartis, N. I. M. Gould and Ph. L. Toint, "Adaptive cubic regularisation methods for unconstrained optimization. Part I: motivation, convergence and numerical results" *Mathematical Programming* 127(2) (2011) 245-295,

and uses "tricks" as suggested in

N. I. M. Gould, M. Porcelli and Ph. L. Toint, "Updating the regularization parameter in the adaptive cubic regularization algorithm". *Computational Optimization and Applications* 53(1) (2012) 1-22.

1.2 Call order

To solve a given problem, functions from the arc package must be called in the following order:

- [arc_initialize](#) - provide default control parameters and set up initial data structures
- [arc_read_specfile](#) (optional) - override control values by reading replacement values from a file
- [arc_import](#) - set up problem data structures and fixed values
- solve the problem by calling one of
 - [arc_solve_with_mat](#) - solve using function calls to evaluate function, gradient and Hessian values
 - [arc_solve_without_mat](#) - solve using function calls to evaluate function and gradient values and Hessian-vector products

- `arc_solve_reverse_with_mat` - solve returning to the calling program to obtain function, gradient and Hessian values, or
- `arc_solve_reverse_without_mat` - solve returning to the calling program to obtain function and gradient values and Hessian-vector products
- `arc_information` (optional) - recover information about the solution and solution process
- `arc_terminate` - deallocate data structures

See Section 6.1 for examples of use.

1.3 Symmetric matrix storage formats

The symmetric n by n matrix $H = \nabla_{xx}f$ may be presented and stored in a variety of formats. But crucially symmetry is exploited by only storing values from the lower triangular part (i.e, those entries that lie on or below the leading diagonal).

Both C-style (0 based) and fortran-style (1-based) indexing is allowed. Choose `control.f_indexing` as `false` for C style and `true` for fortran style; the discussion below presumes C style, but add 1 to indices for the corresponding fortran version.

1.3.1 Dense storage format

The matrix H is stored as a compact dense matrix by rows, that is, the values of the entries of each row in turn are stored in order within an appropriate real one-dimensional array. Since H is symmetric, only the lower triangular part (that is the part H_{ij} for $0 \leq j \leq i \leq n - 1$) need be held. In this case the lower triangle should be stored by rows, that is component $i * i/2 + j$ of the storage array `H_val` will hold the value H_{ij} (and, by symmetry, H_{ji}) for $0 \leq j \leq i \leq n - 1$.

1.3.2 Sparse co-ordinate storage format

Only the nonzero entries of the matrices are stored. For the l -th entry, $0 \leq l \leq ne - 1$, of H , its row index i , column index j and value H_{ij} , $0 \leq j \leq i \leq n - 1$, are stored as the l -th components of the integer arrays `H_row` and `H_col` and real array `H_val`, respectively, while the number of nonzeros is recorded as `H_ne = ne`. Note that only the entries in the lower triangle should be stored.

1.3.3 Sparse row-wise storage format

Again only the nonzero entries are stored, but this time they are ordered so that those in row i appear directly before those in row $i+1$. For the i -th row of H the i -th component of the integer array `H_ptr` holds the position of the first entry in this row, while `H_ptr(n)` holds the total number of entries plus one. The column indices j , $0 \leq j \leq i$, and values H_{ij} of the entries in the i -th row are stored in components $l = H_ptr(i), \dots, H_ptr(i+1)-1$ of the integer array `H_col`, and real array `H_val`, respectively. Note that as before only the entries in the lower triangle should be stored. For sparse matrices, this scheme almost always requires less storage than its predecessor.

```

Data Fields

- bool [f_indexing](#)
use C or Fortran sparse matrix indexing
- int [error](#)
error and warning diagnostics occur on stream error
- int [out](#)
general output occurs on stream out
- int [print_level](#)
the level of output required.
- int [start_print](#)
any printing will start on this iteration
- int [stop_print](#)
any printing will stop on this iteration
- int [print_gap](#)
the number of iterations between printing
- int [maxit](#)
the maximum number of iterations performed
- int [alive_unit](#)
removal of the file `alive_file` from unit `alive_unit` terminates execution
- char [alive_file](#) [31]
see `alive_unit`
- int [non_monotone](#)
the descent strategy used.
- int [model](#)
the model used.
- int [norm](#)
the regularization norm used.
- int [semi_bandwidth](#)
specify the semi-bandwidth of the band matrix P if required

- int [lbfgs_vectors](#)
number of vectors used by the L-BFGS matrix P if required
- int [max_dxc](#)
number of vectors used by the sparsity-based secant Hessian if required
- int [icfs_vectors](#)
number of vectors used by the Lin-More' incomplete factorization matrix P if required
- int [mi28_lsize](#)
the maximum number of fill entries within each column of the incomplete factor L computed by HSL_MI28. In general, increasing `.mi28_lsize` improve the quality of the preconditioner but increases the time to compute and then apply the preconditioner. Values less than 0 are treated as 0
- int [mi28_rsize](#)
the maximum number of entries within each column of the strictly lower triangular matrix R used in the computation of the preconditioner by HSL_MI28. Rank-1 arrays of size `.mi28_rsize * n` are allocated internally to hold R . Thus the amount of memory used, as well as the amount of work involved in computing the preconditioner, depends on `.mi28_rsize`. Setting `.mi28_rsize > 0` generally leads to a higher quality preconditioner than using `.mi28_rsize = 0`, and choosing `.mi28_rsize >= .mi28_lsize` is generally recommended
- int [advanced_start](#)
try to pick a good initial regularization weight using `.advanced_start` iterates of a variant on the strategy of Sartenaer SISC 18(6) 1990:1788-1803
- real_wp [stop_g_absolute](#)
overall convergence tolerances. The iteration will terminate when the norm of the gradient of the objective function is smaller than $\text{MAX}(\text{.stop_g_absolute}, \text{.stop_g_relative} * \text{norm of the initial gradient or if the step is less than .stop_s})$
- real_wp [stop_g_relative](#)
see `stop_g_absolute`
- real_wp [stop_s](#)
see `stop_g_absolute`
- real_wp [initial_weight](#)
Initial value for the regularisation weight (-ve => $1/||g_0||$)
- real_wp [minimum_weight](#)
minimum permitted regularisation weight
- real_wp [reduce_gap](#)
expert parameters as suggested in Gould, Porcelli & Toint, "Updating the regularization parameter in the adaptive cubic regularization algorithm" RAL-TR-2011-007, Rutherford Appleton Laboratory, England (2011), <http://epubs.stfc.ac.uk/bitstream/6181/RAL-TR-2011-007.pdf> (these are denoted `beta`, `epsilon_chi` and `alpha_max` in the paper)
- real_wp [tiny_gap](#)
see `reduce_gap`
- real_wp [large_root](#)
see `reduce_gap`
- real_wp [eta_successful](#)
a potential iterate will only be accepted if the actual decrease $f - f(x_{\text{new}})$ is larger than `.eta_successful` times that predicted by a quadratic model of the decrease. The regularization weight will be decreased if this relative decrease is greater than `.eta_very_successful` but smaller than `.eta_too_successful` (the first is `eta` in Gould, Porcell and Toint, 2011)
- real_wp [eta_very_successful](#)
see `eta_successful`
- real_wp [eta_too_successful](#)
see `eta_successful`
- real_wp [weight_decrease_min](#)
on very successful iterations, the regularization weight will be reduced by the factor `.weight_decrease` but no more than `.weight_decrease_min` while if the iteration is unsuccessful, the weight will be increased by a factor `.weight_increase` but no more than `.weight_increase_max` (these are `delta_1`, `delta_2`, `delta3` and `delta_max` in Gould, Porcelli and Toint, 2011)
- real_wp [weight_decrease](#)

- see weight_decrease_min*
- real_wp_ [weight_increase](#)
 - see weight_decrease_min*
- real_wp_ [weight_increase_max](#)
 - see weight_decrease_min*
- real_wp_ [obj_unbounded](#)
 - the smallest value the onjective function may take before the problem is marked as unbounded*
- real_wp_ [cpu_time_limit](#)
 - the maximum CPU time allowed (-ve means infinite)*
- real_wp_ [clock_time_limit](#)
 - the maximum elapsed clock time allowed (-ve means infinite)*
- bool [hessian_available](#)
 - is the Hessian matrix of second derivatives available or is access only via matrix-vector products?*
- bool [subproblem_direct](#)
 - use a direct (factorization) or (preconditioned) iterative method to find the search direction*
- bool [renormalize_weight](#)
 - should the weight be renormalized to account for a change in preconditioner?*
- bool [quadratic_ratio_test](#)
 - should the test for acceptance involve the quadratic model or the cubic?*
- bool [space_critical](#)
 - if .space_critical true, every effort will be made to use as little space as possible. This may result in longer computation time*
- bool [deallocate_error_fatal](#)
 - if .deallocate_error_fatal is true, any array/pointer deallocation error will terminate execution. Otherwise, computation will continue*
- char [prefix](#) [31]
 - all output lines will be prefixed by .prefix(2:LEN(TRIM(.prefix))-1) where .prefix contains the required string enclosed in quotes, e.g. "string" or 'string'*

4.1.1 Detailed Description

control derived type as a C struct

Examples

[arct.c](#), and [arctf.c](#).

4.1.2 Field Documentation

4.1.2.1 model

`int model`

the model used.

Possible values are

- 0 dynamic (*not yet implemented*)
- 1 first-order (no Hessian)
- 2 second-order (exact Hessian)
- 3 barely second-order (identity Hessian)
- 4 secant second-order (limited-memory BFGS, with `.lbfgs_vectors` history) (*not yet implemented*)
- 5 secant second-order (limited-memory SR1, with `.lbfgs_vectors` history) (*not yet implemented*)

4.1.2.2 non_monotone

`int non_monotone`

the descent strategy used.

Possible values are

- ≤ 0 a monotone strategy is used.
- anything else, a non-monotone strategy with history length `.non_monotone` is used.

4.1.2.3 norm

`int norm`

the regularization norm used.

The norm is defined via $\|v\|^2 = v^T P v$, and will define the preconditioner used for iterative methods. Possible values for P are

- -3 users own preconditioner
- -2 P = limited-memory BFGS matrix (with `.lbfgs_vectors` history)
- -1 identity (= Euclidan two-norm)
- 0 automatic (*not yet implemented*)
- 1 diagonal, $P = \text{diag}(\max(\text{Hessian}, \text{.min_diagonal}))$
- 2 banded, $P = \text{band}(\text{Hessian})$ with semi-bandwidth `.semi_bandwidth`

- 3 re-ordered band, $P = \text{band}(\text{order}(A))$ with semi-bandwidth `.semi_bandwidth`
- 4 full factorization, $P = \text{Hessian}$, Schnabel-Eskow modification
- 5 full factorization, $P = \text{Hessian}$, GMPS modification (*not yet implemented*)
- 6 incomplete factorization of Hessian, Lin-More'
- 7 incomplete factorization of Hessian, HSL_MI28
- 8 incomplete factorization of Hessian, Munskgaard (*not yet implemented*)
- 9 expanding band of Hessian (*not yet implemented*)
- 10 diagonalizing norm from GALAHAD_DPS (*subproblem_direct only*)

4.1.2.4 print_level

```
int print_level
```

the level of output required.

- ≤ 0 gives no output,
- $= 1$ gives a one-line summary for every iteration,
- $= 2$ gives a summary of the inner iteration for each iteration,
- ≥ 3 gives increasingly verbose (debugging) output

The documentation for this struct was generated from the following file:

- [arc/arc.h](#)

4.2 arc_inform_type Struct Reference

```
#include <arc.h>
```

Data Fields

- int [status](#)
return status. See `ARC_solve` for details
- int [alloc_status](#)
the status of the last attempted allocation/deallocation
- char [bad_alloc](#) [81]
the name of the array for which an allocation/deallocation error occurred
- int [iter](#)
the total number of iterations performed
- int [cg_iter](#)
the total number of CG iterations performed
- int [f_eval](#)
the total number of evaluations of the objection function
- int [g_eval](#)
the total number of evaluations of the gradient of the objection function
- int [h_eval](#)
the total number of evaluations of the Hessian of the objection function
- int [factorization_status](#)
the return status from the factorization
- int [factorization_max](#)
the maximum number of factorizations in a sub-problem solve
- int [max_entries_factors](#)
the maximum number of entries in the factors
- int [factorization_integer](#)
the total integer workspace required for the factorization
- int [factorization_real](#)
the total real workspace required for the factorization
- real_wp_ [factorization_average](#)
the average number of factorizations per sub-problem solve
- real_wp_ [obj](#)
the value of the objective function at the best estimate of the solution determined by the package.
- real_wp_ [norm_g](#)
the norm of the gradient of the objective function at the best estimate of the solution determined by the package.
- real_wp_ [weight](#)
the current value of the regularization weight
- struct [arc_time_type](#) [time](#)
timings (see above)

4.2.1 Detailed Description

inform derived type as a C struct

Examples

[arct.c](#), and [arctf.c](#).

The documentation for this struct was generated from the following file:

- [arc/arc.h](#)

4.3 arc_time_type Struct Reference

```
#include <arc.h>
```

Data Fields

- [real_sp_total](#)
the total CPU time spent in the package
- [real_sp_preprocess](#)
the CPU time spent preprocessing the problem
- [real_sp_analyse](#)
the CPU time spent analysing the required matrices prior to factorizatio
- [real_sp_factorize](#)
the CPU time spent factorizing the required matrices
- [real_sp_solve](#)
the CPU time spent computing the search direction
- [real_wp_clock_total](#)
the total clock time spent in the package
- [real_wp_clock_preprocess](#)
the clock time spent preprocessing the problem
- [real_wp_clock_analyse](#)
the clock time spent analysing the required matrices prior to factorizat
- [real_wp_clock_factorize](#)
the clock time spent factorizing the required matrices
- [real_wp_clock_solve](#)
the clock time spent computing the search direction

5.1.1 Function Documentation

5.1.1.1 `arc_import()`

```
void arc_import (
    struct arc\_control\_type * control,
    void ** data,
    int * status,
    int n,
    const char H_type[],
    int ne,
    const int H_row[],
    const int H_col[],
    const int H_ptr[] )
```

Import problem data into internal storage prior to solution.

Parameters

in	<i>control</i>	is a struct whose members provide control paramters for the remaining pcedures (see arc_control_type)
in, out	<i>data</i>	holds private internal data
in, out	<i>status</i>	is a scalar variable of type int, that gives the exit status from the package. Possible values are: <ul style="list-style-type: none"> • 0. The import was succesful • -1. An allocation error occurred. A message indicating the offending array is written on unit control.error, and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively. • -2. A deallocation error occurred. A message indicating the offending array is written on unit control.error and the returned allocation status and a string containing the name of the offending array are held in inform.alloc_status and inform.bad_alloc respectively. • -3. The restriction $n > 0$ or requirement that type contains its relevant string 'dense', 'coordinate', 'sparse_by_rows', 'diagonal' or 'absent' has been violated.
in	<i>n</i>	is a scalar variable of type int, that holds the number of variables
in	<i>H_type</i>	is a one-dimensional array of type char that specifies the symmetric storage scheme used for the Hessian. It should be one of 'coordinate', 'sparse_by_rows', 'dense', 'diagonal' or 'absent', the latter if access to the Hessian is via matrix-vector products; lower or upper case variants are allowed
in	<i>ne</i>	is a scalar variable of type int, that holds the number of entries in the lower triangular part of H in the sparse co-ordinate storage scheme. It need not be set for any of the other three schemes.
in	<i>H_row</i>	is a one-dimensional array of size ne and type int, that holds the row indices of the lower triangular part of H in the sparse co-ordinate storage scheme. It need not be set for any of the other three schemes, and in this case can be NULL
in	<i>H_col</i>	is a one-dimensional array of size ne and type int, that holds the column indices of the lower triangular part of H in either the sparse co-ordinate, or the sparse row-wise storage scheme. It need not be set when the dense or diagonal storage schemes are used, and in this case can be NULL
in	<i>H_ptr</i>	is a one-dimensional array of size n+1 and type int, that holds the starting position of each row of the lower triangular part of H, as well as the total number of entries plus one, in the sparse row-wise storage scheme. It need not be set when the other schemes are used, and in this case can be NULL

Examples

[arct.c](#), and [arctf.c](#).

5.1.1.2 arc_information()

```
void arc_information (
    void ** data,
    struct arc_inform_type * inform,
    int * status )
```

Provides output information

Parameters

in, out	<i>data</i>	holds private internal data
out	<i>inform</i>	is a struct containing output information (see arc_inform_type)
out	<i>status</i>	is a scalar variable of type int, that gives the exit status from the package. Possible values are (currently): <ul style="list-style-type: none"> • 0. The values were recorded succesfully

Examples

[arct.c](#), and [arctf.c](#).

5.1.1.3 arc_initialize()

```
void arc_initialize (
    void ** data,
    struct arc_control_type * control,
    struct arc_inform_type * inform )
```

Set default control values and initialize private data

Parameters

in, out	<i>data</i>	holds private internal data
out	<i>control</i>	is a struct containing control information (see arc_control_type)
out	<i>inform</i>	is a struct containing output information (see arc_inform_type)

Examples

[arct.c](#), and [arctf.c](#).

5.1.1.4 `arc_read_specfile()`

```
void arc_read_specfile (
    struct arc\_control\_type * control,
    const char specfile[] )
```

Read the content of a specification file, and assign values associated with given keywords to the corresponding control parameters

Parameters

in, out	<i>control</i>	is a struct containing control information (see arc_control_type)
in	<i>specfile</i>	is a character string containing the name of the specification file

5.1.1.5 `arc_solve_reverse_with_mat()`

```
void arc_solve_reverse_with_mat (
    void ** data,
    int * status,
    int * eval_status,
    int n,
    real_wp_ x[],
    real_wp_ f,
    real_wp_ g[],
    int ne,
    real_wp_ H_val[],
    const real_wp_ u[],
    real_wp_ v[] )
```

Find a local minimizer of a given function using a regularization method.

This call is for the case where $H = \nabla_{xx}f(x)$ is provided specifically, but function/derivative information is only available by returning to the calling procedure

Parameters

in, out	<i>data</i>	holds private internal data
---------	-------------	-----------------------------

Parameters

<code>in, out</code>	<code>status</code>	<p>is a scalar variable of type <code>int</code>, that gives the entry and exit status from the package.</p> <p>On initial entry, <code>status</code> must be set to 1. Possible exit are:</p> <ul style="list-style-type: none"> • 0. The import was succesful • -1. An allocation error occurred. A message indicating the offending array is written on <code>unit.control.error</code>, and the returned allocation status and a string containing the name of the offending array are held in <code>inform.alloc_status</code> and <code>inform.bad_alloc</code> respectively. • -2. A deallocation error occurred. A message indicating the offending array is written on <code>unit.control.error</code> and the returned allocation status and a string containing the name of the offending array are held in <code>inform.alloc_status</code> and <code>inform.bad_alloc</code> respectively. • -3. The restriction $n > 0$ or requirement that type contains its relevant string 'dense', 'coordinate', 'sparse_by_rows', 'diagonal' or 'absent' has been violated. • -7. The objective function appears to be unbounded from below • -9. The analysis phase of the factorization failed; the return status from the factorization package is given in the component <code>inform.factor_status</code> • -10. The factorization failed; the return status from the factorization package is given in the component <code>inform.factor_status</code>. • -11. The solution of a set of linear equations using factors from the factorization package failed; the return status from the factorization package is given in the component <code>inform.factor_status</code>. • -16. The problem is so ill-conditioned that further progress is impossible. • -18. Too many iterations have been performed. This may happen if <code>control.maxit</code> is too small, but may also be symptomatic of a badly scaled problem. • -19. The CPU time limit has been reached. This may happen if <code>control.cpu_time_limit</code> is too small, but may also be symptomatic of a badly scaled problem. • -40. The user has forced termination of solver by removing the file named <code>control.alive_file</code> from unit <code>unit.control.alive_unit</code>.
----------------------	---------------------	---

Parameters

	<i>status</i>	(continued) <ul style="list-style-type: none"> 2. The user should compute the objective function value $f(x)$ at the point x indicated in x and then re-enter the function. The required value should be set in f, and $eval_status$ should be set to 0. If the user is unable to evaluate $f(x)$— for instance, if the function is undefined at x— the user need not set f, but should then set $eval_status$ to a non-zero value. 3. The user should compute the gradient of the objective function $\nabla_x f(x)$ at the point x indicated in x and then re-enter the function. The value of the i-th component of the g gradient should be set in $g[i]$, for $i = 0, \dots, n-1$ and $eval_status$ should be set to 0. If the user is unable to evaluate a component of $\nabla_x f(x)$ — for instance if a component of the gradient is undefined at x —the user need not set g, but should then set $eval_status$ to a non-zero value. 4. The user should compute the Hessian of the objective function $\nabla_{xx} f(x)$ at the point x indicated in x and then re-enter the function. The value l-th component of the Hessian stored according to the scheme input in the remainder of H should be set in $H_val[l]$, for $l = 0, \dots, ne-1$ and $eval_status$ should be set to 0. If the user is unable to evaluate a component of $\nabla_{xx} f(x)$ — for instance, if a component of the Hessian is undefined at x — the user need not set H_val, but should then set $eval_status$ to a non-zero value. 6. The user should compute the product $u = P(x)v$ of their preconditioner $P(x)$ at the point x indicated in x with the vector v and then re-enter the function. The vector v is given in v, the resulting vector $u = P(x)v$ should be set in u and $eval_status$ should be set to 0. If the user is unable to evaluate the product— for instance, if a component of the preconditioner is undefined at x — the user need not set u, but should then set $eval_status$ to a non-zero value.
in, out	<i>eval_status</i>	is a scalar variable of type int, that is used to indicate if objective function/gradient/Hessian values can be provided (see above)
in	<i>n</i>	is a scalar variable of type int, that holds the number of variables
in, out	<i>x</i>	is a one-dimensional array of size n and type double, that holds the values x of the optimization variables. The j -th component of x , $j = 0, \dots, n-1$, contains x_j .
in	<i>f</i>	is a scalar variable pointer of type double, that holds the value of the objective function.
in, out	<i>g</i>	is a one-dimensional array of size n and type double, that holds the gradient $g = \nabla_x f(x)$ of the objective function. The j -th component of g , $j = 0, \dots, n-1$, contains g_j .
in	<i>ne</i>	is a scalar variable of type int, that holds the number of entries in the lower triangular part of the Hessian matrix H .
in	<i>H_val</i>	is a one-dimensional array of size ne and type double, that holds the values of the entries of the lower triangular part of the Hessian matrix H in any of the available storage schemes.
in, out	<i>u</i>	is a one-dimensional array of size n and type double, that is used for reverse communication (see above for details)
in, out	<i>v</i>	is a one-dimensional array of size n and type double, that is used for reverse communication (see above for details)

Examples

Chapter 6

Example Documentation

6.1 arct.c

This is an example of how to use the package both when the Hessian is directly available and when its product with vectors may be found. Both function call evaluations and returns to the calling program to find the required values are illustrated. A variety of supported Hessian storage formats are shown.

Notice that C-style indexing is used, and that this is flagged by setting `control.f_indexing` to false. In addition, see how parameters may be passed into the evaluation functions via `userdata`.

```
/* arct.c */
/* Full test for the ARC C interface using C sparse matrix indexing */
#include <stdio.h>
#include <math.h>
#include "arc.h"
// Custom userdata struct
struct userdata_type {
    double p;
};
// Function prototypes
int fun( int n, const double x[], double *f, const void * );
int grad( int n, const double x[], double g[], const void * );
int hess( int n, int ne, const double x[], double hval[], const void * );
int hess_dense( int n, int ne, const double x[], double hval[], const void * );
int hessprod( int n, const double x[], double u[], const double v[], bool got_h,
