# Chapter 1

## GALAHAD C package

### 1.1 Introduction

#### 1.1.1 Purpose

Given a sparse symmetric  $n \times n$  matrix  $A = a_{ij}$  and the factorization of  $A$  found by the GALAHAD package SLS, this package **solves the system of linear equations**  $Ax = b$  **using iterative refinement**.

Currently, only the control and inform parameters are exposed; these are provided and used by other GALAHAD packages with C interfaces.

#### 1.1.2 Authors

N. I. M. Gould, STFC-Rutherford Appleton Laboratory, England.

C interface, additionally J. Fowkes, STFC-Rutherford Appleton Laboratory.

#### 1.1.3 Originally released

October 2008, C interface January 2022

### 2.1 File List

Here is a list of all files with brief descriptions:

<a href="#">ir.h</a> . . . . .	5
--------------------------------	---

## Chapter 3

# File Documentation

### 3.1 ir.h File Reference

```
#include <stdbool.h>
#include "galahad_precision.h"
```

#### Data Structures

- struct [ir\\_control\\_type](#)
- struct [ir\\_inform\\_type](#)

#### 3.1.1 Data Structure Documentation

##### 3.1.1.1 struct ir\_control\_type

control derived type as a C struct

##### Data Fields

bool	f_indexing	use C or Fortran sparse matrix indexing
int	error	unit for error messages
int	out	unit for monitor output
int	print_level	controls level of diagnostic output
int	itref_max	maximum number of iterative refinements allowed
real_wp_	acceptable_residual_relative	refinement will cease as soon as the residual $\ Ax - b\ $ falls below $\max(\text{acceptable\_residual\_relative} * \ b\ , \text{acceptable\_residual\_absolute})$
real_wp_	acceptable_residual_absolute	see acceptable_residual_relative
real_wp_	required_residual_relative	refinement will be judged to have failed if the residual $\ Ax - b\  \geq \text{required\_residual\_relative} * \ b\ $ . No checking if required_residual_relative < 0
bool	record_residuals	record the initial and final residual
bool	space_critical	if space is critical, ensure allocated arrays are no bigger than needed
bool	deallocate_error_fatal	exit if any deallocation fails
char	prefix[31]	all output lines will be prefixed by <code>prefix(2:LEN(TRIM(.prefix))-1)</code> where prefix contains the required string enclosed in quotes, e.g. "string" or 'string'

### 3.1.1.2 struct ir\_inform\_type

inform derived type as a C struct

#### Data Fields

int	status	reported return status: <ul style="list-style-type: none"><li>• 0 the solution has been found</li><li>• -1 an array allocation has failed</li><li>• -2 an array deallocation has failed</li></ul>
int	alloc_status	STAT value after allocate failure.
char	bad_alloc[81]	name of array which provoked an allocate failure
real_wp_	norm_initial_residual	infinity norm of the initial residual
real_wp_	norm_final_residual	infinity norm of the final residual
